This manual provides the technical information necessary for servicing the FT-840 hf transceiver. It does not include information on specifications, installation and operation, which are described in the FT-840 Operating Manual, provided with the transceiver, or on FT-840 accessories, which are described in the manuals provided with each.

Servicing this equipment requires expertise in handling surface-mount chip components. Attempts by non-qualified persons to service this equipment may result in permanent damage not covered by warranty.

For the major circuit boards, each side of the board is identified by the type of the majority of components installed on that side. In most cases one side has only chip components, and

the other has either a mixture of both chip and leaded component (trimmers, coils, electrolytic capacitors, packaged ICs, etc.), or leaded components only.

While we believe the technical information in this manual is correct, Yaesu assumes no liability for damage that may occur as a result of typographical errors that may be present. Your cooperation in pointing out any inconsistencies in the technical information would be appreciated.

Yaesu Musen reserves the right to make changes in this transceiver and the alignment procedures, in the interests of technological improvement, without notification of the owners.

Chip Component Information

Replacing Chip Components

Chip components are installed at the factory by a series of robots. The first one places a spot of adhesive resin at the location where each part is to be installed, and later robots handle and place parts using vacuum suction.

For single-sided boards, solder paste is applied and the board is then baked to harden the resin and flow the solder. For double-sided boards, no solder paste is applied, but the board is baked (or exposed to ultra-violet light) to cure the resin before dip soldering.

In our laboratories and service shops, small quantities of chip components are mounted manually by applying a spot of resin, placing them with tweezers, and then soldering by very small dual streams of hot air (without physical contact during soldering). We remove parts by first removing solder using a vacuum suction iron, which applies a light, steady vacuum at the iron tip, and then breaking the adhesive with tweezers.

The special vacuum soldering/desoldering equipment is recommended if you expect to do a lot of chip replacements. Otherwise, it is usually possible to remove and replace chip components with only a tapered, temperature-controlled soldering iron, a set of tweezers and braided copper solder wick. Soldering iron temperature should be less than 280 °C (536 °F).

Precautions for Chip Replacement

- ✗ Do not disconnect a chip forcefully, or the foil pattern may peel off the board.
- ✗ Never re-use a chip component. Dispose of all removed chip components immediately to avoid mixing with new parts.
- ✗ Limit soldering time to 3 seconds or less to avoid damaging the component and board.

Removing Chip Components

- Remove the solder at each joint, one joint at a time, using solder wick whetted with non-acidic flux as shown below. Avoid applying pressure, and do not attempt to remove the tinning from the chip's electrode.

- Grasp the chip on both sides with tweezers, and gently twist the tweezers back and forth (to break the adhesive bond) while alternately heating each electrode. Be careful to avoid peeling the foil traces from the board. Dispose of the chip when removed.

- After removing the chip, use the copper braid and soldering iron to which away any excess solder and smooth the land for installation of the replacement part.

Chip Component Information

Install a Replacement Chip

As the value of some chip components is not indicated on the body of the chip, be careful to get the right part for replacement.

- Apply a small amount of solder to the land on one side where the chip is to be installed. Avoid too much solder, which may cause bridging (shorting to other parts).

- Hold the chip with tweezers in the desired position, and apply the soldering iron with a motion line that indicated by the arrow in the diagram below. Do not apply heat for more than 3 seconds.

- Remove the tweezers and solder the electrode on the other side in the manner just described.

Circuit Board Access

Unit Access

- Turn the transceiver off and disconnect all cables.
- Remove the 5 screws affixing the top cover. Lift the top cover slightly, and disconnect the speaker cable plug from its connector. You may now remove the top cover to expose the component side of the Main Unit (photos 1 & 2).
- Place the set upside-down on the work surface, then remove the 6 screws affixing the bottom cover. Remove the cover to expose the components side of the Local Unit (photos 3 & 4).
- To remove the PA Unit (with the set upside-down), remove the 2 screws affixing the PA Unit to the transceiver chassis (photo 5).
- Next remove the connecting wire and coaxial cables leading from the Main and Local Units, then remove the PA Unit from the chassis (photo 6).

Lithium Back-up Battery Replacement, Backup Switch & Case Cover Screws

Lithium Back-up Battery Replacement

- With the top and bottom covers removed, locate the Lithium Battery on the Local Unit (photo ???).
- Using your finger, slide the battery inward, then slightly pry up the outer edge of the battery, so that it ejects freely upward and outward through the slots at the top and bottom of the holder.
- Carefully note the polarity (+ side facing up) and battery type information.
- Install the replacement battery in the reverse manner.

Backup Switch

Located next to the Lithium Battery is the memory back-up switch **S2002** labeled "**BACK-UP**". It is normally kept in the **ON** position to ensure that memorized information is maintained (by a small amount of power from the lithium battery) when the radio is off, or the DC power source is removed.

If you do not plan to operate your radio for extended periods of time, turn the switch to the **OFF** position to conserve battery life. Move the selector using the tip of a ball-point pen or similar object. To prolong battery life, ensure that the radio is turned on when switching the back-up switch from **OFF** to **ON**. This reduces the current demand placed on the battery by the radio's circuits from an un-powered state.

Case Cover Screws

Please note that there are *three* different types of screws used for top & bottom cover attachment, and front panel assembly.

Refer to the figure at the right for proper screw identification and below for location.

Front Panel Access Pilot Lamp Replacement

Front Panel Access

- Lay the transceiver on the work surface with the forward end of the case extending slightly over the edge of the surface (photo 7).

Photo 7

- With the top and bottom covers removed, loosen the 2 forward screws, and remove the remaining 2 rear screws on the front panel assembly, as shown in photo 8.

Photo 8

- Note the track cut-out (guide) for the two remaining (loosened) screws. Slide the front panel assembly forward slightly in the guide, then fold it gently down, to expose the rear of the front panel assembly wiring and components (photo 9).

Photo 9

Pilot Light Replacement

- To replace the pilot lamp, gently pull the bulb from its silicone rubber mount as shown in photo 10. Trace the lamp leads to clamp connector J1031, located on the forward edge of the Main Unit PCB.

Photo 10

- Using your thumb and forefinger, grasp the outer ridges of the connector, and lift up the locking clamp. The pilot lamp leads can now be removed from the connector.

Connector J1031

- To insert the new lamp, simply install the leads into J1031, press the locking clamp shut, and insert the bulb gently into the mounting insert as before.

Notes

Alignment

The FT-840 is carefully designed to allow the knowledgeable operator to make nearly all adjustments required for various station conditions, modes and operator preferences simply from the controls on the front and rear panels, without opening the case of the transceiver. These adjustments, plus certain internal settings, are described in the *FT-840 Operating Manual*.

The following procedures cover the sometimes critical and tedious adjustments that are not normally required once the transceiver has left the factory. However, if damage occurs and some parts are subsequently replaced, realignment may be required. If a sudden problem occurs during normal operation, it is likely due to component failure; realignment should not be done until after the faulty component has been replaced.

We recommend that servicing be performed only by authorized Yaesu service technicians, experienced with the circuitry and fully equipped for repair and alignment. So if a fault is suspected, you should contact the selling dealer for instructions regarding repair. Authorized Yaesu service technicians have the latest modification information, and realign all circuits and make complete performance checks to ensure compliance with factory specifications after replacing faulty components.

Those who do undertake any of the following alignments are cautioned to proceed at their own risk. Problems caused by unauthorized attempts at realignment are not covered by the warranty policy. Also, Yaesu must reserve the right to change circuits and alignment procedures in the interest of improved performance, without notifying owners.

Under no circumstances should any alignment be attempted unless the normal function and operation of the transceiver are clearly understood, the cause of the malfunction has been clearly pinpointed and any faulty components replaced, and the need for realignment determined to be absolutely necessary.

The following test equipment (and thorough familiarity with its correct use) is necessary for complete realignment. Correction of problems caused by misalignment resulting from use of improper test equipment is not covered under the warranty policy. While most steps do not require all of the equipment listed, the interactions of some adjustments may require that more complex adjustments be performed afterwards. Do not attempt to perform only a single step unless it is clearly isolated electrically from all other steps. Rather, have all test equipment ready before beginning, and follow all of the steps in a section in the order they are presented.

- Digital DC Voltmeter (high-Z, >1 M Ω /V)
- RF Millivoltmeter
- AF Millivoltmeter
- RF Standard Signal Generator w/calibrated output and dB scale, 0 dB μ = 0.5 μ V
- AF Signal Generator with calibrated output
- Frequency Counter
- 50- Ω Dummy Load (150 – 250 watts)
- 16.6- Ω Dummy Load (>150 W)
- In-Line Wattmeter (150 – 250 W, 50- Ω)
- RF Attenuator (>150-W, 40-dB) or coupler

Alignment Preparation & Precautions

A 50- Ω dummy load and inline wattmeter must be connected to the antenna jack in all procedures that call for transmission, except where specified otherwise. Correct alignment is not possible with an antenna.

Except where specified otherwise, the transceiver should be tuned to 14.200 MHz, USB mode, and these controls set as indicated:

- MOX & VOX** buttons OFF (■)
- AGC-F** button ON (—)
- ATT, PROC, AGC-F & NB** buttons OFF (■)
- SQL & RF PWR** fully ccw (minimum)

Alignment

- AF** as required, **MIC** fully cw (maximum)
- SHIFT** to 12-o'clock

After completing one step, read the following step to determine whether the same test equipment will be required. If not, remove the test equipment (except dummy load and wattmeter, if connected) before proceeding.

Correct alignment requires that the ambient temperature be the same as that of the transceiver and test equipment, and that this temperature be held constant between 20 and 30 °C (68 ~ 86 °F). If the transceiver is brought into the shop from hot or cold air it should be allowed some time for thermal equalization with the environment before alignment.

Alignments must only be made with oscillator shields and circuit boards firmly affixed in place. Only one extender board should be installed at a time for access to the board being aligned. Also, the test equipment must be thoroughly warmed up before beginning.

Note: Signal levels in dB referred to in alignment are based on 0 dBμ = 0.5 μV.
